

QuantumCap // Financial Analytics Dashboard

An elegant, production-grade responsive financial analytics dashboard interacting directly with asynchronous REST API market endpoints. Built natively with modern JavaScript architecture to demonstrate robust engineering patterns.

🚀 Key Engineering Focus Areas for Interviewers

When reviewing this codebase, the technical implementations display mastery over core frontend patterns expected of a software engineering intern:

- * **Asynchronous JavaScript & Exception Pipelines:** Features clean async data collection routines utilizing native `fetch` wrappers backed by explicit try/catch blocks capable of gracefully parsing HTTP network failure modes instead of locking UI interactions.
- * **Decoupled State Management Structure:** Business logic state (`State``) is distinctly separated away from DOM mutation commands. UI state synchronizes seamlessly down through explicit tracking arrays.
- * **Performant Client-Side Filter Arrays:** Implements string matching array filtering routines running inside memory blocks without forcing repetitive external REST network strain during interactive keystroke adjustments.
- * **Advanced Web Native API Layout Interfacing:** Reuses complex `Intl.NumberFormat`` localized string construction blocks for clean display data parsers, coupled with dynamic structural inline template string DOM node modifications.
